Bonderized/Paint Grip Steel

Bonderized/paint grip steel is manufactured by taking galvanized steel and burning off a large portion of the rust protection to get the dull gray effect.

When left unpainted, in a short period of time you get rusty red streaks on the material.

Water based paints used today continually expose the weakened surface to moisture.

Paint Grip Metallic Aluminum

If you use Bonderized/paint grip steel for the look:

Paint Grip Metallic is a lightweight, price conscious alternative with a baked on finish that does not rust.

If you use Bonderized/paint grip steel to paint:

Paint Grip Metallic's matte finish is formulated to accept paint without the rust when color matching is desired.
